

BUSKIT TOOLS

Every Musician's Companion Tool

Everything you need for a live performance — low-latency live sound processing, without a pedalboard and without a professional amplifier

The **Buskit Tools** app is a tool built for Android phones with the needs of musicians in mind – for live performances as well as personal or group practice – and it works for any type of instrument, Iranian or otherwise. Apps with somewhat similar features do exist, but this app's capabilities and performance in live use set it apart – except for apps with jaw-dropping prices that require brand-new, cutting-edge phones. All the free versions, meanwhile, suffer from heavy latency that makes genuine live playing practically impossible.

Problems It Solves

- No need to carry multiple pedals or expensive pedalboards
- No need for a professional amplifier system
- No need for mains power or batteries
- No need for a professional recording system to capture performances

Key Benefits

- Rich, dreamy sound effects always at hand
- A tool for practicing playing together with others
- Practice any time, anywhere, without disturbing those around you
- Always with you – adds no extra weight
- Compatible with most phones, even fairly old ones
- Extremely low latency – makes real live performance possible

Current Version Features

- Metronome with rhythmic figures
- Microtonal tuner (Koron / Sori)
- Backing track with adjustable speed
- Direct recording on the phone

Popular effects: 9-band equalizer, compressor, delay, 6 reverb types, phaser, flanger & chorus, overdrive & distortion, lowpass filter, exciter, wah-wah, noise gate and limiter

Ways to Connect Your Instrument to the App

1 Phone Handsfree Kit and Its Microphone

Plug the handsfree kit into your phone, put on the headphones, launch the app, and load the effect or rhythm you want; you'll now hear your instrument's sound, shaped with whatever ambience you like, through the headphones.

Ideal for electric guitarists practicing in the middle of the night – no amplifier needed, and no disturbance to those around you.

2 iRig Device

This device is widely available and about the size of two AA batteries. It requires a bridge pickup on the instrument or a clip-on/adhesive piezo microphone. Connect the device to your phone with the included cable, feed the microphone output into the iRig's input, and connect its output to headphones or an amplifier.

Any speaker with an Aux input is enough – no need for a professional amplifier with a preamp.

Popular effects: 9-band equalizer, compressor, delay, 4 reverb types, phaser, flanger & chorus, vibrato, 5 overdrive/distortion types, lowpass filter, exciter, wah-wah, noise gate and limiter
